13

15 The present research was conducted with the aim of identifying the subjective patterns of managers and experts of Iranian Fisheries Organization regarding organizational transformation. The 16 research was carried out with the participation of a number of managers and experts of the Fisheries 17 Organization who were selected by a purposeful sampling approach. The main research method 18 19 for collecting required data was in-depth interview. After reviewing and summarizing 75 statements extracted from the interviews, 41 statements were finally selected as Q samples. After 20 21 sorting Q statements, exploratory factor analysis and varimax rotation approach were employed to identify subjective patterns. The results revealed that five different subjective patterns can be 22 23 identified among the managers and experts of the Iranian Fisheries Organization regarding the organizational transformation, which explained 72.87% of the total variance in the factor analysis 24 25 model. The results of factor analysis indicated that the subjective patterns identified included participatory policies, capacity development and change management, appropriate organizational 26 27 structures, incentives for change, and clarification of financial and administrative affairs. In the end, it was recommended that it is very important to develop more units and mechanisms within 28 the organization for communication and interaction with other actors. Rereading and amending the 29 regulations related to the support of the information system in the organization is an undeniable 30 necessity that can develop and institutionalize the teamwork culture in the fisheries organization. 31 In addition, the results of present study can facilitate the organizational transformation and 32 ultimately increase the success and responsiveness of the fisheries organization. 33

Keywords: Iranian Fisheries Organization, Organizational transformation, Q methodology,
 Subjective patterns.

36 1. Introduction

The change is the only stable principle of the world (Sterman, 2000; Filho & Raath, 2018; 37 38 Insulander, 2019). Because, in the current uncertain context and conditions, instability is the most dangerous threat for the organizations (Farjoun, 2007; Dust et al., 2018). Based on this, 39 organizations are forced to innovation and continuous and permanent changes for their survival 40 and dynamism (Tim et al., 2019; Abdul-Kahar, 2020). Organizations often make decisions 41 42 considering operational improvements or choosing new business opportunities to maximize their profits. Therefore, managers in the process of change must have high skills to make others aware 43 44 of the necessity of change. In other words, they should be able to convince their subordinates and guide changes in the desired direction (Logemann et al., 2018). In general, in today's world, it is 45 46 not enough to use past experiences to solve the current and future problems of the organization. Therefore, the managers of the organizations should think of another way to provide goods and 47 services with minimum cost and superior quality according to market and customer needs. 48 Therefore, cooperative behaviors are performed with the intention of helping others (Ahmadi et 49 50 al., 2020; Ben Slimane & Padilla-Angulo, 2018).

According to what was mentioned earlier, in the current era, investigating and studying the process 51 of managing organizational change is essential, important, and necessary (Sudhir, 2018). In fact, 52 transformation is a special type of change. Change means the process of innovation in the members 53 of an organization (Chen et al., 2015). In other words, organizational transformation is a continuous 54 and fundamental change based on theory, values, and practical methods that leads to the 55 reconstruction and dynamism of the entire organization (Hanif et al., 2014; Hornstein, 2015; 56 Hornstein, 2015). Nevertheless, organizational transformation and human capital management in 57 organizations of different countries are facing many challenges (Garcia et al., 2015). For example, 58 59 globalization, lack of skilled and committed workforce, lack of recognition of employees' needs, lack of plan, lack of meritocracy, discrimination, insufficient productivity of human resources, lack 60 of motivation, lack of employee participation (in decision-makings, organization policy meetings, 61 and other affaires), and lack of cooperation between the organizations and experienced employees 62 63 are just some of the main challenges of the organization in many countries of the world (Sudhir, 2018; Chen et al., 2015; Zhao et al., 2019). 64

In the meantime, organizations in countries such as Iran, due to international sanctions and their specific national and international policies, experience inherently more difficult conditions than

organizations in countries with more economic stability. For example, the review of the reports of 67 the Iranian Fisheries Organization shows that this organization has many issues and problems, such 68 69 as the lack of experienced labor, the decrease in the productivity of human resources, the lack of motivation in the employees, the decrease in hope for the future, the lack of active participation, 70 ack of effective communication with other organizations, lack of satisfaction of employees and 71 clients, and weakness in planning (Kotwani, 2020). In addition, due to the rapid changes and 72 73 developments in the environment, the Iranian Fisheries Organization is not an exception to this rule and must be able to respond to the diverse demands of the users and owners in accordance with 74 75 their needs and at the right time (Haskell et al., 2014; Adeniji et al., 2018; Mogholi & Zarei, 2020). From the perspective of researchers (see Janežič et al., 2018; Khan, 2019; Tim et al., 2019), 76 77 organizational transformation is one of the most key answers to these challenges. In other words, such fast and complex business environments in today's organizations require organizational 78 79 transformation (Khan, 2019). This is despite the fact that there is not much desire for organizational transformation in Iranian organizations such as the Iranian Fisheries Organization. There are many 80 81 obstacles for non-transformation in Iranian organizations. For example, issues such as stagnation, monotony, deterioration of work ethics, lack of innovation, centralized planning system, lack of 82 designing power (Akhvan-Alaf, 2015), lack of performance evaluation system, structural and 83 organizational problems, overlapping tasks, not prioritizing quality policies, lack of appropriate 84 criteria for selecting employees, the lack of meritocracy in taking organizational positions 85 (Sevedjavadin & Moshfegh, 2008) are among the most important obstacles to the lack of 86 organizational transformation in Iran (Tahri Attar et al., 2018; Imran et al., 2019; Alipour and 87 Alizadeh, 2017; Hakimzadeh et al., 2019). 88

Also, studies (see Alipour and Alizadeh, 2017; Nazifi et al., 2018; Tielen, 2008) show that the mental patterns of managers of organizations such as the Iranian Fisheries Organization can play a key role in organizational transformation. For example, Nazifi et al. (2018) sate that identifying the mental patterns of managers can help to change the future policies of organizations. Yasini et al. (2017) also claim that identifying mental patterns can lead to increased sensitivity and responsibility of managers in line with organizational transformation.

95 Preliminary investigations show that despite the importance and role of the mental patterns of 96 managers of the Iranian Fisheries Organization in the organizational transformation, sufficient 97 studies have not been conducted in this field (Jalilian et al., 2023). In addition, organizational

transformation in the fisheries organization and any other organization is dynamic, and this process 98 depends on the various organizational, social, and economic components specific to that 99 100 organization. Therefore, the results of researches that have examined the role of managers' mental patterns on organizational transformation in other organizations cannot be generalized for the 101 102 fisheries organization. As a result, the current research suggests the lack of sufficient understanding of the mental patterns of managers of the Iranian Fisheries Organization as the main research gap. 103 104 In order to fill this research gap, identifying the mental patterns of managers and experts of the 105 Iranian Fisheries Organization regarding organizational transformation was determined as the main 106 goal of the research. In general, it can be mentioned that this research has three novelties or original contributions. First, the current research is innovative because it examines the issue of 107 organizational transformation in the Iranian Fisheries Organization. To the best our knowledge no 108 other research has been done in the field of organizational transformation in the Iranian Fisheries 109 Organization. Second, this research uses the Q methodology to identify the mental patterns of 110 managers and experts in the fisheries organization. The application of this methodology to examine 111 the mental patterns of managers and experts in the Iranian Fisheries Organization has also been 112 done for the first time. Thirdly, this research leads to the identification and development of the 113 intellectual framework of managers and experts in the fisheries organization. By identifying the 114 determinants of organizational transformation from the point of view of managers and experts, the 115 116 present research provides insights for practical organizational transformation and improving the success and accountability of the organization. 117

118

119 2. Materials and methods

120 **2.1. Type of research**

This study was conducted in January and February 2023. In terms of paradigm, it is mixed (combination of qualitative and quantitative methods) study and in terms of purpose, it is considered as an applied exploratory study. Q methodology steps were used to sequence the research steps. Therefore, the phase of examining the situation and forming the concourse environment was done using a qualitative approach. Quantitative stage was also done using Q factor analysis approach.

127

128

130 **2.2. Population**

The statistical population was managers and experts of Iran Fisheries Organization. Referring to the report of the Iranian Fisheries Organization, the number of experts and managers was 30, of which 14 were selected as samples. Details about the number of samples and the sampling method have been provided in Q methodology section (Section 4-2). However, it should generally be noted that the Iranian Fisheries Organization consists of 4 general directors, each of whom has 2 deputies, and each deputy has 2 to 3 heads of specialized groups. Finally, head of specialized group works with 2 to 3 subject experts.

138

139 2.3. Steps of Q methodology

140 The Q method is a quasi-quantitative method whose purpose is to find and describe mental patterns

- 141 and identify the agreement and contradiction in people's perspectives, opinions, and preferences
- about a specific issue (Stevenson, 2015; Ramlo, 2016).
- 143

144 2.3.1. Choosing the participants and definition of the concourse or Q population

In order to create a concourse environment in Q methodology, it was necessary to select 145 participants who can provide sufficient and accurate information in the field of organizational 146 147 transformation in the Iranian Fisheries Organization. For this purpose, by consulting various members of the organization, one of the experts was selected as the first participant and a semi-148 149 structured questionnaire was provided to him. After finishing the interview with the first participant, he was asked to introduce another person for the second interview. This process 150 continued until the selection of the 14th expert and/or manager. It should be noted that the 151 researchers concluded from the 11th to the 14th interview that the continuation of the sampling 152 153 process does not add new insights to the previous results about the organizational transformation. In this regard, after the end of the semi-structured interview with the 14th participant, the sampling 154 process was stopped. In other words, at this stage, the researchers came to the conclusion that 155 theoretical saturation has been achieved about the organizational transformation in the Iranian 156 Fisheries Organization. It should be noted that the validity of the semi-structured questionnaire that 157 was used at this stage was reviewed and confirmed by several experts in the field of behavioral and 158 management sciences. It should also be noted that in order to analyze the text of the interviews, 159 160 MAXQDA12 textual data analysis software was used. The results of these 14 interviews were used to form the concourse environment. The concourse environment actually includes a comprehensive 161

and diverse set of materials related to the literature of the research subject (Van Exel & DeGraaf,
2005). In this research, Q population/concourse environment included 75 statements which were
drawn through 14 semi-structured interviews and research and study of scientific articles.

165

166 **2.3.2. Forming and evaluating the Q sample**

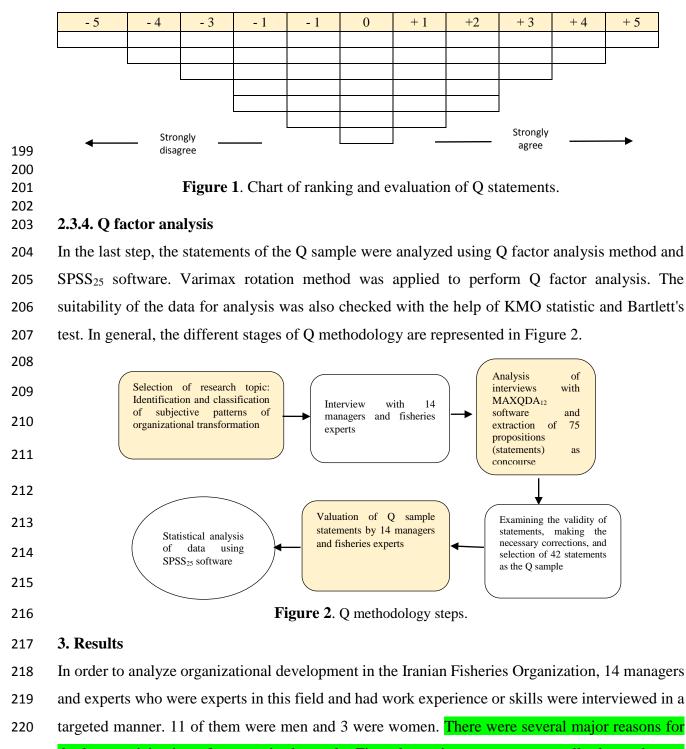

Q samples are actually statements or phrases about the research topic (Adams et al., 2020). At this 167 stage, in order to summarize the statements related to the concourse environment and create a 168 manageable set of statements, the concourse matrix method was used. In other words, at this stage, 169 170 75 statements constituting Q concourse environment/population were evaluated. In order to obtain a suitable sample of the concourse environment, similar and repeated statements were combined 171 or some of them that had less connection with the issue of organizational transformation in the 172 Iranian Fisheries Organization were removed. In addition, the extracted statements were given to 173 174 four participants to give their opinions on. After collecting the opinions and making the requested corrections for the statements, the research questionnaire was finalized. This work helped to verify 175 the validity of the research tool. After summarizing the results at this stage, a special set of 176 statements was obtained, which was considered as the Q sample. Q sample included 41 statements, 177 the complete list of which is given in the following sections and in the form of Table 3. 178

179

180 2.3.3. Q ranking

In this step, according to Yoshizawa et al. (2016), the final cards for ranking were given to the managers and experts, and they were asked to rank the statements based on forced distribution in the charts. For this purpose, a matrix was provided to the managers/experts to easily sort Q samples based on forced distribution. In order to achieve the purpose of classification, the Q-chart for 41 statements of the research was adjusted in such a way that they could evaluate the set of statements

186 in a symmetrical distribution from strongly agree (+5) to strongly disagree (-5) (Figure 1).

- the low participation of women in the study. First, the senior managers generally do not have a
- positive attitude towards the managerial and specialized skills of women in the fisheries
 organization. Second, in many Iranian organizations such as the Fisheries Organization, there are
- 224 mainly cultural beliefs against women's management. In other words, many members of

- organizations believe that the head of organizations should not be a woman. Thirdly, historically, 225 226 women in Iran have always been placed in positions where they had to do repetitive work and occupy low-level organizational positions. Fourth, organizations such as the Fisheries Organization 227 are not compatible with women's characteristics and these organizations are generally patriarchal. 228 The analysis of the data collected from the interviews resulted in 75 propositions that formed the 229 discourse space in the field of organizational transformation in the Iranian Fisheries Organization. 230 Then, the validity of the propositions was evaluated based on the views of four interviewees and 231 three university professors (with expertise in organizational transformation). After making the 232 233 necessary corrections, 41 statements were finally selected as Q samples. The results of this section are presented in the form of mental patterns in Table 3. 234
- 235

236 **3.1. Q factor analysis**

In the quantitative part, 41 statements related to the Q sample were evaluated in the form of a forced 237 distribution matrix by 14 managers and experts of the Fisheries Organization. The results of Q 238 factor analysis demonstrated that the reported values for KMO statistic and Bartlett's sphericity test 239 are 0.62 and 219.859, respectively. Based on the results of this section, the values of these indices 240 were significant at the 0.01 level, which indicated the suitability of the data for Q factor analysis. 241 Also, a scree plot diagram was used to show the amount of variance explained by the most 242 important factors (Figure 3). The results of this figure are based on the eigenvalue index. According 243 to the results of this diagram, it can be concluded that there are five distinct subjective patterns 244 among managers and experts. Based on the results of the Q factor analysis using the principal 245 components method, managers and experts were divided into five groups according to the 246 difference in their perspectives and opinions about the effective factors in organizational 247 transformation. As the results reported in Table 1, the first (first factor), second (second factor), 248 third (third factor), fourth (fourth factor), and fifth (fifth factor) subjective patterns could account 249 for 24.45%, 15.52%, 11.20%, 11%, and 10.69% of the total variance of the factor analysis model, 250 251 respectively.

253

254

Group	Subjective pattern	Variance %	Cumulative variance percentage	Eigen value
1	Participatory policies	24.45	24.45	3.42
2	Capacity development and change management	15.52	39.98	2.17
3	Appropriate organizational structure	11.20	51.18	1.56
4	Incentives for change	11.00	62.18	1.54
5	Clarification of financial and administrative affairs	10.69	72.87	1.49

Table 1. Subjective patterns extracted from Q factor analysis and the amount of variance explained by each subjective pattern.

256

259 **3.2. Rotated matrix of the factors**

Table 2 shows the summary of the results related to the rotated matrix of the factors. The results of this section also show the managers who have the subjective patterns in a classified manner. Considering that the loading factors are greater than $\frac{2.58}{\sqrt{n}}$, it can be claimed with 99% confidence that the obtained loading factors are statistically significant (Table 2). It should be noted that *n* is equal to the Q sample (41 statements). According to the above formula, the standard limit for loading factors was calculated as 0.40. Considering that the loading factors specified in Table 2 have values greater than 0.40, it can be mentioned that the first, second, third, and fourth managers and experts jointly had subjective pattern 1. Sixth, seventh and fourteenth managers and experts all had subjective pattern 2. In addition, the fifth and eighth managers and experts were the only participants who had subjective pattern 3. Based on the results of Q factor analysis, the ninth and thirteenth participants had subjective pattern 4. Finally, tenth, eleventh and twelfth managers and experts were also categorized in the subjective pattern 5. The basis of naming the subjective patterns was the existence of common traits and characteristics among the types of mentalities among the managers and experts participating in the research.

Table 2. The rotated matrix of the correlation of the managers and experts' perspectives in each of the subjective patterns

Participants' code	Subjective pattern 1	Subjective pattern 2	Subjective pattern 3	Subjective pattern 4	Subjective pattern 5
1	0.897	- 0.009	0.052	0.067	- 0.052
2	0.884	0.013	0.017	0.001	- 0.010
3	0.886	- 0.085	0.005	- 0.027	- 0.053
4	0.820	- 0.274	- 0.058	-0.013	- 0.006
6	- 0.224	0.850	0.226	0.035	- 0.025
7	- 0.014	0.919	- 0.108	0.004	0.033
14	- 0.025	0.504	0.132	0.574	0.014
5	- 0.118	0.029	0.825	0.097	0.089
8	0.257	0.215	0.0.504	- 0.172	- 0.097
9	- 0.330	- 0.149	0.463	0.507	- 0.024
13	0.173	- 0.043	- 0.147	0.879	0.068
10	0.111	-0.024	0.213	- 0.137	0.832
11	- 0.272	0.444	- 0.483	0.284	0.448
12	- 0.161	-0.043	- 0.181	0.189	0.757

In Table 3, the views of each of the managers and experts were ranked on Q statements. Doing this made it possible to find out what rank each of the Q statements get in each of the mental patterns. As the results of Table 3 show, in the first, second, third, fourth, fifth, and sixth mental patterns, the items related to participatory policies, capacity development and change management, appropriate organizational structures, incentives for change, and clarification of financial and administrative affairs have been assigned the highest ranks.

Table 3. Scores of each statement based on the load factor in the subjective patterns of experts and managers.

Statement	Subjective pattern 1: Participatory policies	Subjective pattern 2: Capacity development and change management	Subjective pattern 3: Appropriate organizational structure	Subjective pattern 4: Incentives for change	Subjective pattern 5: Clarification of financial and administrative affairs

Increasing the quantity and quality of standards	14	3	32	40	33

305

306

4. Discussion and implication

307 4.1. Subjective pattern 1: Participatory policies

The first subjective pattern had an eigen value of 3.42 and could explain 24.45% of the total variance. Due to the conceptual and semantic affinity of the statements, this subjective pattern was named "participatory policies". According to the ranking of the statements (Table 3) and based on the subjective pattern of the managers who were categorized in this pattern it can be argued that participatory policies create the basis for interaction and communication with other organizations.

In addition, such policies lead to strengthening interactions between institutions and receiving 313 314 support from these institutions. As a result, the feeling of effectiveness of giving and receiving 315 advice from colleagues and experts is strengthened. Involving all the stakeholders in the processes related to decision-making and evaluation of reports of aquaculture activities leads to increasing 316 recognition and awareness about the importance of the participation of representatives of fisheries-317 related organizations in decision-making and solving challenges. To implement this subjective 318 319 pattern and use it for organizational transformation, it is suggested to use three key strategies. First, participatory policy-making for the purpose of organizational transformation requires consulting 320 and seeking advice from colleagues. Second, the organization should try to interact constructively 321 with other fisheries-related organizations and involve their representatives in decision-makings. 322 Thirdly, the organization should try to do collaborative research with other organizations and 323 institutions. This can help to involve all the stakeholders in all the processes of decision-making 324 and evaluations and ultimately organizational transformation. 325

326

4.2. Subjective pattern 2: Capacity development and change management

The eigen value and explained variance of this subjective pattern were 2.17 and 15.52%, 328 respectively. The interviewees believed that having new competencies related to communication, 329 330 facilitation, and intermediacy can accelerate identifying and developing new opportunities for technical and organizational innovations and building skills in the field of information and 331 communication technology for organizational transformation. In addition, a employees' desire to 332 333 use these technologies and innovations in their job activities can lead to their empowerment in the field of skills and competencies required by the information system and organizational 334 transformation. In addition, the rapid sharing of information has a significant effect on better 335 336 acquisition of knowledge and new information on job duties. This issue can make employees play a role as an effective member in the organization. In other words, they can properly analyze the 337 338 existing issues and problems and provide solutions for them through communicating with different 339 parts of the organization's information system in crisis situations. In other words, the conditions 340 within the organization should be such that it leads to strengthening the interactions of the 341 employees of the research, education, and extension departments of the fisheries organization. 342 They should believe that they can influence the organization's goals and help to accept and establish 343 the information system in the fisheries organization. In order to implement this subjective pattern 344 (capacity development and change management) and create organizational transformation using it,

some key strategies are suggested. Firstly, opportunities for continuous learning of experts and 345 managers should be created in order to change their attitude towards the organizational 346 transformation. Secondly, managers should provide meaningful support for organizational 347 transformation in order to operationalize initiatives, ideas, and opinions of experts in order to 348 improve services. Thirdly, the communication and interaction of research institutes and universities 349 should be strengthened. This can lead to the support of aquaculture as well as the production and 350 transfer of valid findings to other relevant departments and organizations. Fourthly, interactions 351 between the research, education, and extension departments with the fisheries organization should 352 be strengthened. This can provide opportunities for more experts of this organization to attend 353 internal and external conferences. Fifth, in order to increase the willingness to accept organizational 354 355 change among employees and reduce their resistance to organizational change, a preliminary needs assessment study should be conducted. 356

357

4.3. Subjective pattern 3: Appropriate organizational structure

The eigen value and the explained variance of the third subjective pattern were equal to 1.56 and 359 11.20%, respectively. According to the perspectives of the managers and experts in this subjective 360 pattern and the importance score of the statements (Table 3), it can be concluded that according to 361 362 the existing organizational structures, communication with other information systems of the organization is possible. Of course, it should be mentioned that this work requires the support of 363 the senior managers of the fisheries organization. Therefore, it is very important to develop more 364 units and mechanisms within the organization for communication and interaction with other actors. 365 Rereading and amending the regulations related to the support of the information system in the 366 organization is an undeniable necessity that can develop and institutionalize the teamwork culture 367 in the fisheries organization. In order to take advantage of the opportunity that this subjective model 368 has created in the organization, some important considerations should be taken into account. 369 Firstly, efforts should be made to use individuals with expertise and experience in the management 370 positions of the Fisheries Organization. Secondly, positions with similar or identical duties should 371 372 be merged with each other to avoid parallel work in the organization. Thirdly, proper communications should be formed between different units and departments of the organization. 373 374 Fourthly, in the recruitment process, the organization should try to hire human resources who have 375 more skills and experience than other applicants.

377 4.4. Subjective pattern 4: Incentives for change

Two of the study participants had this subjective pattern. Its eigen value was 1.54 and explained 378 11% of the total variance. The subjective pattern of change incentives shows that managers and 379 experts believe that employees can be justified by explaining the benefits of establishing a suitable 380 information system in the organization, assigning appropriate salaries to experts, providing fair 381 382 insurance and welfare services, and justifying the cost. The information system causes an increase 383 in employees' desire to replace the traditional management system with new information systems. In this regard, it seems that paying more attention to/providing incentives for the initiative of 384 experts and encouraging them to acquire new skills in the field of information can be an efficient 385 strategy in the field of organizational transformation. Also, the support of officials and policy-386 387 makers for organizational transformation and the formation of discussion forums and training workshops can lead to an increase in people's interest in group work that produces practical results. 388 389 In addition to these cases, a person's belief that something is wrong in the fisheries organization and must be changed, and that there is a deep gap between the current structure of the organization 390 391 and the desired situation, provides the basis for concrete changes in this field. In other words, the conditions within the fisheries organization should be such that the members can understand the 392 relationship between their work and its consequences. 393

394

4.5. Subjective pattern 5: Clarification of financial and administrative affairs

According to the results of the research, three of the participants had this subjective pattern. The 396 eigen value of this pattern was 1.49 and it explained about 10.69% of the total variance. The 397 perspectives of the managers and experts of this group show that in order to develop transparent 398 procedures and instructions, it is necessary to define the responsibilities in a more specific and 399 400 transparent manner. Because, this prevents the parallel work of devices and departments under the supervision of the organization. Also, clearly specifying the program implementation procedure 401 402 leads to increasing the credit allocation necessary for the development of information and communication technology. Therefore, it is recommended that the rules and regulations in the 403 organization to support the information system be reviewed and modified to create a teamwork 404 culture in the organization. Also, hiring skilled and experienced human resources can be effective 405 406 in determining the goals and strategies related to organizational transformation in the organization. 407 This action itself can be effective in determining the duties of different departments in connection 408 with the organizational transformation in the fisheries organization.

409 5. Conclusion, limitations, and future directions

The current research was focused on capturing and analyzing the subjective patterns of managers 410 411 and experts in line with organizational transformation in the Iranian Fisheries Organization. The general conclusion of the study was that the managers and experts have five different subjective 412 patterns, which in order of importance (the variance explained by each of these patterns) include 413 participatory policies, capacity development and change management, appropriate organizational 414 415 structures, incentives for change, and clarification of financial and administrative affairs. Present research ended with three important conclusions. First, for the purpose of organizational 416 transformation, organizations such as the Iranian Fisheries Organization should consider 417 cooperative policies and the development of organizational capacities for change management as 418 419 a turning point. Second, organizations should provide infrastructure and organizational structures suitable for organizational transformation. It can be mentioned that providing change incentives at 420 421 this stage can act as a trigger. Change incentives usually originate from the organizational environment or the environment outside the organization. These incentives include factors like new 422 423 technology or changes in government regulations. Also, the inefficiency of managers can be an incentive for change in the organization. There are forces and incentives in the environment that 424 increase the need for change. These incentives include external and internal incentives such as the 425 environment, organizational requirements, cultural requirements, the nature of the workforce, 426 427 technology, economic shocks, competition, social trends, global policies, the behavior of 428 employees and managers, the mindset of leaders and employees. Third, lack of financial and 429 administrative transparency leads to lack of trust and unwillingness to implement the principles of organizational transformation. In this regard, organizations and their managers should try to 430 approve and implement the regulations related to the transparency of financial and administrative 431 affairs in order to lay the groundwork for the realization of organizational transformation. Although 432 in many cases there are limitations for this work and in the initial stages of implementing such a 433 policy, the efficiency of the organization may experience decreases due to the competition of the 434 organization's management competitors, in the long term it can lead to an increase in efficiency 435 436 and concentration of tasks in the organization. In this way, organizational transformation will happen in the long term. In general, it can be noted that the present research, by identifying the 437 438 subjective patterns of managers and experts, proposes three operational steps for organizational transformation. Following these three steps and the strategies proposed in each of them can help 439

organizational transformation happens more easily. The realization of this can help organizations 441 442 to adapt to the ever-increasing developments and changes of the present era in a more practical 443 way. This study had some limitations that should be discussed in this section. First, organizational 444 transformation is a complex phenomenon and different constructs (subjective patterns) are 445 446 considered as factors affecting it. Therefore, beyond the factors identified in this research, there may be other constructs for the organizational transformation of Iranian fisheries Organization that 447 the current research did not address. Second, this research was carried out only in the Iranian 448 Fisheries Organization and the sampling was done scientifically. Therefore, the results indicate that 449 the model of subjective patterns is of great reliability. Nevertheless, testing the model of present 450

governments, organizations, policy-makers, managers, experts, employees, and other users so that

- 451 research using other statistical methods such as structural equation modeling and repeating this
- research in other organizations can greatly contribute to the strength of the research results. Third,
 due to the fact that the research tool was based on self-reporting system, some considerations and
- 454 administrative issues may have influenced the responses of the participants in the process of
- 455 conducting the research. Therefore, it is suggested that future researchers use other methods to
- 456 collect similar information. Comparing the results of the present research with the results of
- 457 researches that are conducted with methods other than self-reporting system, can provide more
- 458 further insights about the topic. This does not mean that the results of present study are not suitable
- 459 for the international readers or Q methodology is not the best method to reveal subjective views of
- the respondents with their similarity and difference, but it refers to the limitations of the study that
- should be kept in mind by the readers and users of the results.
